

ABSTRACT

The Main aim of Weather Reporting System is to update weather report on an hourly or daily basis of a city. We aim to demonstrate the use of create, read, update and delete MySQL operations through this project. Any user who wishes to add the details of his city can register and do so. There is no restriction or privilege given to any specific user. Once registration is done, the user can add, delete or update a weather report based on his requirement. The use of trigger and stored procedure is also provided in the report. Trigger used here is to automatically add the number of users who have added their data in the User table.
